

# eSports - Programming (Formative) Name: \_\_\_\_\_

September 13, 2022

Mr. Frey

**Goal:** to demonstrate introductory programming skills and basic game design

Create a game in TinkerCAD for the MicroBit. The game needs to have

- 2 or more characters displayed with independent motion upon each clock tick
- Controls to shift direction of the character in at least 2 directions
- Collision checks to keep the characters in play
- Collision checks for reward/penalty (win/lose)
- Appropriate response to each collision (Stop, bounce, relocate, etc)

Tuesday:

- decide on the object of the game
- create variables to hold the coordinates of each character
- create variables to hold the vector for each character
- setup the starting positions and vectors for each character
- setup the clock to move each character by their vectors

Wednesday:

- add button controls that change the vectors of the avatar
- add collision checks to make sure players stay within the boundary

Thursday:

- add collision checks for each penalty/reward.

Friday:

- Write a brief explanation of your game (title, goal, control)
- send a cropped screen-snap of your program code
- send a cropped screen-snap of your MicroBit

**Marking:**

	<b>Level 4</b>	<b>Level 3</b>	<b>Level 2</b>	<b>Level 1</b>
<b>Input Control</b>	Controls vectors for up, down, left, right, and stop	3 controls adjust at least 2 vectors	2 controls for at least 2 vectors	Single vector control
<b>Output Motion</b>	Moves only on clock tick  Moves according to vectors set in the input  Correct plotting of several objects in a variety of motion	Moves only on clock tick  Moves according to vectors set in the input  Correct Plotting of 2 characters in motion.	Movement does not rely on clock tick  Moves by appropriate vectors  Minor error in plotting 2 characters in motion	Movement does not rely on clock tick  Correctly plots movement of a single character.  Previous position of avatar is not erased.
<b>Collision Detection</b>	Complex collision checks (interior walls)	Collision with <ul style="list-style-type: none"> <li>• Boundaries</li> <li>• Reward</li> <li>• Penalty</li> </ul>	Collision with <ul style="list-style-type: none"> <li>• Boundary</li> <li>• object</li> </ul>	Boundary check
<b>Collision Response</b>	Variety of collision responses (bounce, stop, relocate etc)	Avatar responds appropriately to <ul style="list-style-type: none"> <li>• boundary</li> <li>• reward</li> <li>• penalty</li> </ul>	Avatar stays in bounds  Responds to another object	Avatar either strays out of bounds or does not respond to another object
